

AppSec Solutions for Every Need—Including Yours

Web applications are not all created equal: They play various functions (with corresponding levels of business criticality) from one organization to the next. It should come as no surprise, then, that application security programs across organizations can differ significantly in terms of dedicated personnel, tools, and subject matter expertise.

With these challenges in mind, Rapid7 provides several application security solutions; this brief is designed to help you understand which one is right for you.

InsightAppSec

Comprehensive, cloud-powered application security testing for the modern web

AppSpider Enterprise

On-premise application security testing for DevSecOps teams and enterprise-wide use

Managed AppSec

A comprehensive approach to AppSec—from scanning to pen testing—run by our resident experts

TECHNOLOGY SOLUTIONS

It may seem counterintuitive at first, but purchasing an application security testing tool such as Rapid7 [InsightAppSec](#) or [AppSpider Enterprise](#) typically makes the most sense for organizations who are either just starting out in application security, or have reached maturity in this security discipline. Let's explore why.

5 Minutes to a Scan with InsightAppSec

Depending on the needs of your organization, purchasing a product can be more cost-effective than hiring a managed service; in the case of InsightAppSec, we have designed the product for a quick ramp-up and extremely short time-to-value. In other words, you don't need to be an application security expert to scan your applications and gain visibility into your risk with InsightAppSec. For most organizations, InsightAppSec provides the vulnerability detection, compliance reporting, and collaboration features required to effectively manage application security risk.

AppSpider Enterprise for DevSecOps and Mature Organizations

A recent trend in application security is the concept of "[shifting left](#)" in the Software Development Lifecycle, or SDLC. Simply put, this entails security testing applications earlier in the SDLC, before the application is put into production and made available to end users. In order to accomplish this without slowing down development, integrations and automation are often used. For mature application security programs that have established workflows between security and development teams (also known as DevSecOps), Rapid7 offers AppSpider Enterprise. This solution currently offers the broadest range of integrations with continuous integration (CI) tools, ticketing systems, web application firewalls (WAFs), and a public API.

MANAGED SOLUTIONS

When starting a new application security program or even reinvigorating an existing one, one of your considerations should be whether or not your team is staffed to both operate the testing tools and collaborate with development teams to remediate vulnerabilities. This decision typically hinges on the amount of risk that unknown web application vulnerabilities can create for the organization. It's also no secret that the security industry continues to be woefully understaffed, so despite the desire to bring an application security professional in-house, the talent may simply be unavailable.

To that end, Rapid7 offers a [Managed AppSec](#) service alongside its application security products. Rapid7 Managed AppSec provides the tools, expertise, and processes to effectively identify and prioritize application security risks while providing a clear path towards remediation. Vulnerability validation, multi-step authentication, and advanced scan configurations are all included, as well as a named customer advisor who will ensure your service is not just effective at measuring your risk, but also extremely responsive.

INDUSTRY-LEADING TECHNOLOGY ACROSS THE PORTFOLIO

No matter which Rapid7 application security solution best fits your needs, you can be confident in our industry-leading Dynamic Application Security Testing (DAST) technology—the only one built on a [Universal Translator](#)—to scan your applications and exhaustively identify all the vulnerabilities therein.
