Managing Third-Party Vulnerabilities with InsightConnect

Close the Vendor Vulnerability Gap with Automation Powered by InsightConnect

Industry best practices dictate that companies should keep software up-to-date as part of maintaining a healthy security posture. Yet many companies struggle with managing vulnerabilities, especially when it comes to vendor and third-party software.

Third-party vulnerability management is often a balance between ensuring that critical patches are reviewed and applied quickly, while reducing the risk of downtime due to a potentially unstable patch.

When it comes to managing a complex vendor vulnerability management process, Rapid7 InsightConnect is your solution. By orchestrating across communication stack and your existing vulnerability management and patch management tools, InsightConnect enables teams to automate select elements of their organization's vulnerability processes depending on the software affected by the vulnerability and how critical it is.

Challenges for Organizations

Cross-Functional Team Communication

Depending on the vendor software affected by the vulnerability, the security, IT, operations, development, and business leadership teams may all play a part in vulnerability triage and remediation. Wrangling all of the necessary stakeholders and ensuring tasks happen within an SLA timeframe is a time-consuming project management job in and of itself.

Too Many Vendors

Companies that demand best-in-class tools are working across a variety of vendors. Monitoring the security advisory lists manually can get overwhelming quickly for a security or IT engineer.

Save time

Automate effortlessly

Meet compliance drivers

Use your existing security stack

Many Moving Parts

In complex enterprises, tools and process vary from team to team. You've likely purchased several solutions to automate vendor patch management for your various use cases. This means your IT and security operations teams use entirely different systems for applying patches. How do you unify a vendor vulnerability management process given all of these moving parts?

'One Size' Fits All Automation Doesn't Fit

All organizations are different. Along with unique network and software stacks, each company will prioritize vendor software risks differently depending on business needs. Because of this, your third-party vulnerability management process must be specific to your organization—which means you're building the automation yourself, or not automating at all.

InsightConnect: An Orchestration Solution for Your Vulnerability Management Processes and Tools

Using built-in plugins, InsightConnect can monitor an endless number of security advisory feeds, making sure that your IT and security teams are on top of any new security advisory notifications for software that pertains to their environment. With our workflow builder, you can quickly shape any automation to your organization's specific needs.

Conserve Your Workforce's Time

By automating project management work that a human would normally coordinate, we can save your security team's precious time—enabling them to work on higher value, strategic tasks.

Meet Compliance Drivers

With InsightConnect-powered automation, vulnerabilities are responded to efficiently, within SLAs required by compliance and business drivers. Ensure no vulnerabilities fall through the cracks.

Automate Effortlessly

Many teams see a need for vulnerability process automation, but just don't have the development resources to dedicate. With InsightConnect, you can automate with ease, without software engineering resources.

Don't Just Notify, Remediate

By integrating with your patch management solutions, InsightConnect can orchestrate a process from notification to remediation. With every security advisory that comes in, you'll ensure that critical issues are being patched, even if your team is busy fighting fires elsewhere.

AUTOMATING SECURITY PROCESSES HAS NEVER BEEN EASIER

Stop losing time and start gaining productivity with a security orchestration and automation solution that empowers your team to take command of security operations. Visit rapid7.com/insightconnect to get started.
