InsightCloudSec

Continuous Security and Compliance for the Cloud

How do you leverage tools like Amazon Web Services (AWS) with confidence, despite the complexity and speed of changes in cloud environments?

InsightCloudSec is a fully-integrated cloud-native security platform (CNSP) that lets organizations enjoy the speed and scalability of cloud infrastructure without sacrificing security.

InsightCloudSec is built for teams that are looking to standardize security across dozens of accounts or multiple cloud providers. With InsightCloudSec, teams can protect even the most complex cloud and container environments from misconfigurations, policy violations, threats, and identity and access management (IAM) challenges.

InsightCloudSec lets customers instantly detect and respond to security or compliance risks in their cloud environment. By enabling continuous security and compliance for a vast array of cloud environments, including AWS, AWS GovCloud and AWS China, InsightCloudSec lets organizations rapidly innovate while staying secure.

Speed Up Your Cloud Adoption Without Compromise

Understand, Audit, and Monitor Your Security Posture Across All Cloud Resources

InsightCloudSec gives you an inventory of all your assets deployed across the 5 largest cloud providers (including AWS, AWS GovCloud, and AWS China), and lets you use one universal baseline to detect misconfigurations. The result: Reduced complexity and increased efficiency for your team.

✔ **Fix Misconfigurations Automatically in Under 60 Seconds**

Finding misconfigurations is meaningless unless you then do something about them. InsightCloudSec can detect a misconfiguration within 60 seconds and automatically fix it without human intervention.

✔ **Check Off Compliance for Regulatory, Industry, or Custom Standards**

InsightCloudSec provides effortless executive reporting on compliance against required benchmarks, including prepackaged standards (such as PCI, CSI, NIST, and more) and custom options.

✔ **Simplify Identity and Access Management**

InsightCloudSec makes it easy to adopt a least-privilege access model across multi-cloud environments, and helps you uncover risky user or role policies.

✔ **Shift Your Cloud Security Program Left With Infrastructure as Code**

With InsightCloudSec, you can evaluate infrastructure-as-code templates—including Terraform and CloudFormation—against consistent, industry-leading security checks to detect misconfigurations

before they go live. These checks are the same baselines used in the actual cloud environment, providing developers with a consistent definition of good throughout development.

✔ **Secure Kubernetes Deployments Using Frictionless Guardrails**

DevOps teams can maintain smooth operation of business applications and monitor for threats with InsightCloudSec's code-to-production security for Kubernetes deployments and workloads.

Part of the Rapid7 Insight Platform

Rapid7's Insight platform offers an array of solutions to address different cybersecurity needs. The products on the Insight Platform exchange data with one another out of the box, reducing both setup and maintenance for the security team. The Rapid7 Insight Agent is also shared between multiple products, reducing agent fatigue and making it easy to start using additional Rapid7 products in the future.
